PREDICTIVE CUSTOMER CHURN MODEL FOR A TELECOM COMPANY

Introduction:

This project is designed to predict customer churn for a telecom company to help reduce subscriber loss."

For Data Preprocessing:

For Data Preprocessing: This included handling missing values, encoding categorical variables, and scaling numerical features to ensure model stability.

For the Logistic Regression Model: A logistic regression algorithm was selected for its efficiency and interpretability in classification tasks, aimed at identifying the key drivers of customer churn.

For Model Results: The model achieved an impressive accuracy of 98.7% on the test data, demonstrating strong predictive performance.
